

Summary

The invention pertains to a process for switching telephone conversations that are to be paid for by the recipient. In order to provide a process that is less cost intensive and thus economical while simultaneously largely avoiding errors at the time of switching the conversation, the invention proposes a process in which the telephone number of the call recipient is transmitted to a switching system by the caller, and the telephone number is checked in terms of its validity in a databank adjustment unit, and then, following prior authorization by the call recipient, a telecommunications connection is automatically established between the caller and the call recipient.
